# Ruby on Rails

- ❖ First public released in 1995 and it is totally free
- ❖ The TIOBE index ranks Ruby as #9 among programming languages worldwide (with a “A” rating)
- ❖ A new application framework for developing database backed web applications
- ❖ Part of the new emerging technologies and innovation
  - Web 2.0, PHP, Ajax, Dogear, Wiki, etc.
- ❖ Principles
  - Configuration over Convention (CoC)
  - Don't Repeat Yourself (DRY)
- ❖ The Ruby on Rails web development framework is great for small and medium-sized database-backed projects

## What is Ruby

"A dynamic, open source programming language with a focus on simplicity and productivity. It has an elegant syntax that is natural to read and easy to write."

- ❖ Ruby is a pure object-oriented language
  - With classes and objects
  - A scripting language
- ❖ Primarily a text-based, command-line oriented language
- ❖ Much of the syntax is familiar to users of Perl, Python, Java
- ❖ Ruby coding can be done via IDEs such as
  - Vim, Emacs, TextMate
  - Eclipse and NetBeans

PROGRAMMING  
Language <sup>4</sup>

# What is Rails

- ❖ The Rails is a full-stack, open source web framework in Ruby, consists of (pre-configured and ready to run)
  - A Web Server called WEBrick: a http server written in Ruby
    - Contains 4 servlets - handling CGI, ERb, file directories, and a generic Proc servlet
  - A framework for processing HTTP requests and responses
  - A framework for easily persisting data to a relational DB
- ❖ Rails is the framework much like J2EE
  - It is based on the Model View Controller (MVS) architecture
    - the model - responsible for the business logic, application state and the actions to be performed upon that state
    - the view - used to render and present the model to the user (HTML)
    - the controller - defines application behavior
- ❖ Rails provides 'out of the box' scaffolding which can quickly construct most of the models and views needed for a basic website

## Ruby the New Java?

- ❖ No, not really... they each serve different purposes
  - Ruby is an effective tool for small to mid-sized projects
  - Java can be used for enterprise-scale projects
- ❖ Ruby complements Java
  - Use Ruby when need to write a data conversion or text processing utilities
- ❖ Ruby is about speedy delivery and lower cost
  - Productivity claims: 5 to 10 times more productive
- ❖ Ruby is dynamically typed (like in PHP)
  - You don't need to worry about having to declare variables
- ❖ Both Ruby and Java both based on MVC architecture

## Like Java, Ruby is ...

- ❖ Memory is managed for you via a garbage collector
- ❖ Objects are strongly typed
- ❖ There are public, private, and protected methods
- ❖ There are embedded doc tools (Ruby's is called RDoc)
  - The docs generated by rdoc look very similar to those generated by javadoc
- ❖ Some minor syntax differences
- ❖ Based on M-V-C architecture

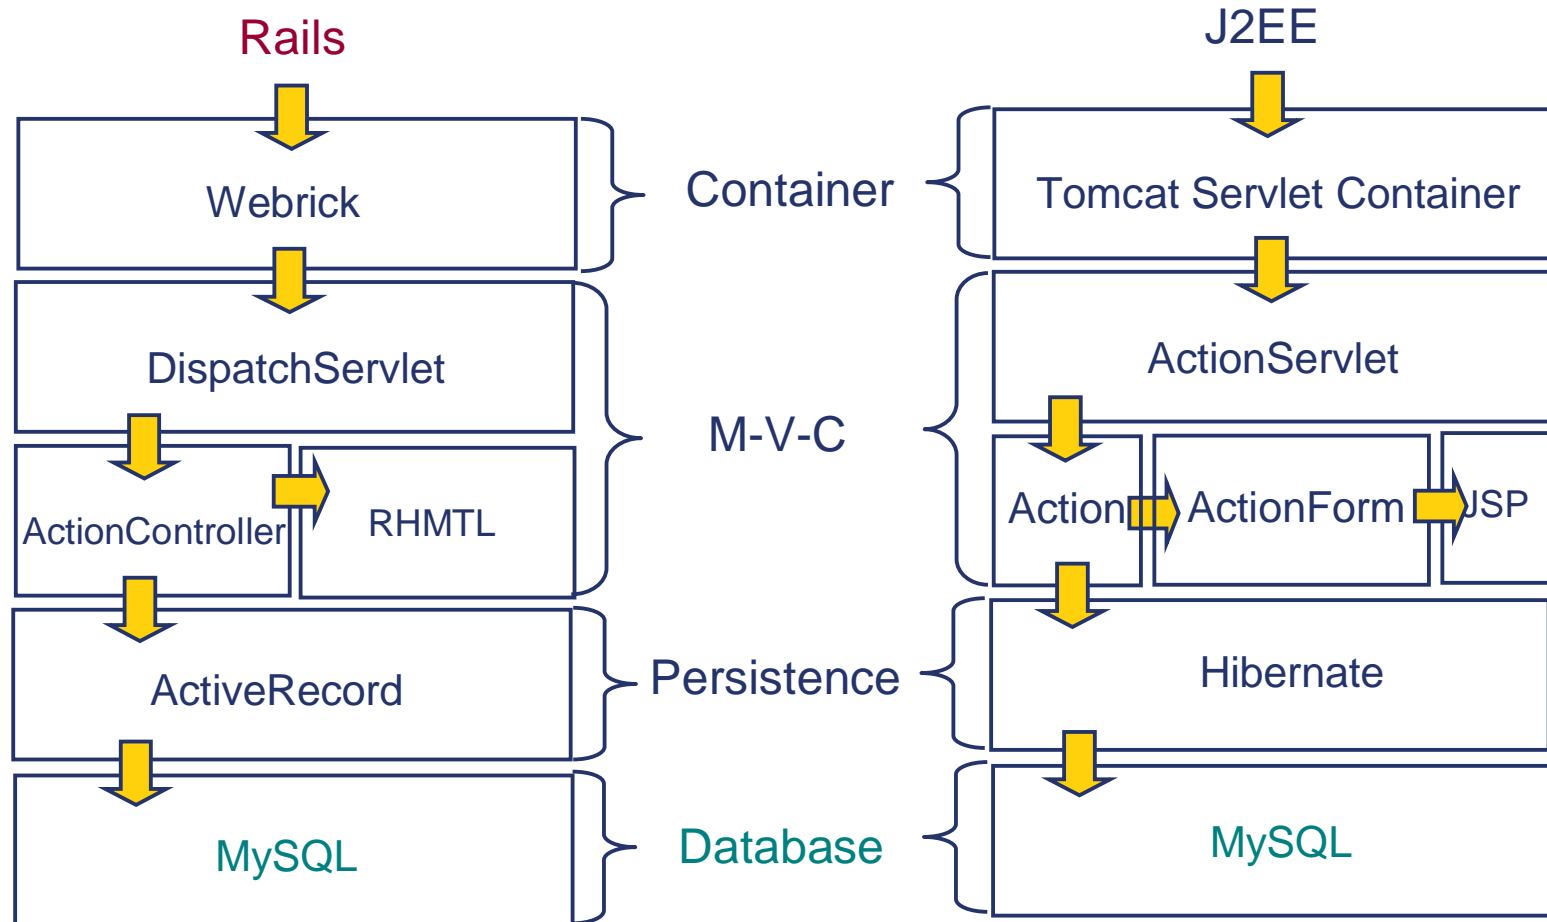

## Unlike Java, Ruby is ...

- ❖ You don't need to compile your code - just run it directly
- ❖ You have "require" instead of "import"
- ❖ You can extend a Ruby classes by adding methods and data
- ❖ RHTML instead of HTML
- ❖ YAML tends to be favored over XML
- ❖ nil instead of null
- ❖ Everything is an object in Ruby
  - Integers, floats, strings even classes and methods are objects
    - Including numbers like 2 and 3.141597
- ❖ All member variables are private
  - From the outside, you access everything via methods
- ❖ The constructor is always named "initialize" instead of the name of the class

# Comparison of Rails and J2EE Stacks

# Ruby and Java Side-by-Side

## ❖ Sample Comparison

Java class for Hello World	<b>Ruby for Hello World</b>
<pre>class HelloWorldApp {   public static void main(String[] args) {     System.out.println("Hello World!");   } }</pre>	<pre>puts [ "Hello World!" ]</pre>

## How Does RoR Compare to Java

- ❖ Open source
- ❖ Enterprise scale
- ❖ Mature, complete and has dominated the Web
- ❖ Industry wide standards-based
- ❖ Portability – Write once and run anywhere
- ❖ Supports Two-phase commit
- ❖ Open source, totally free
- ❖ Not for enterprise scale projects
  - Good for prototyping
- ❖ New technology
  - New programming language
- ❖ Provide out-of-box scaffolding
  - Less convention, easy to learn and be productive
- ❖ Highly Portable just like Java
  - It is developed mostly on GNU/Linux
  - Will work on many types of UNIX, Mac OS X & Windows
- ❖ Ruby features a true mark-and-sweep garbage collector for all Ruby objects

Note: this is not a complete list... by all means

# Ruby Components

- ❖ Ruby
  - Package manager
  - Interactive shell → Interactive Ruby (irb)
- ❖ Rails
  - Web Server (WEBrick)
- ❖ MySQL database
- ❖ Ruby library
  - RubyForge is a popular home for Ruby libraries
  - Browse software map – lists libraries
- ❖ RubyGems
  - A package manager for the Ruby programming language
  - It provides a standard format for distributing Ruby programs and libraries
- ❖ Ruby documentation
  - Core API → <http://www.ruby-doc.org/>
  - Standard API → <http://www.ruby-doc.org/stdlib/>
    - Can be found under lib/ruby/1.x/ directory of a Ruby installation

# Learning Ruby

- ❖ The Basics
- ❖ Define your own classes and methods
- ❖ Control structures
- ❖ GUI with Tk
  - Tk comes with Ruby automatically and its free

# Ruby Basics

- ❖ A Ruby file – Ruby files end with .rb
- ❖ The Ruby Launcher → `#!/usr/local/bin/ruby`
  - The path to your Ruby interpreter called launcher.rb
- ❖ Command-line
  - Windows → `$ ruby launcher.rb`
  - Unix → `$ chmod u+x launcher.rb`  
`$ ./launcher.rb`

# Ruby Syntax Basics

- ❖ # comment – hidden from the Ruby interpreter
- ❖ Class name begin with a capital letter
  - Classes are constants
  - All Ruby constants start with a capital letter
- ❖ One statement per line and no “;”
- ❖ Use “\” for line continuation
- ❖ “n\” forces a line break
- ❖ For a more complete overview of Ruby syntax, please see “Ruby—A Diamond of a Programming Language?”
- ❖ The home of Ruby language
  - <http://www.ruby-lang.org/en/>

# Ruby Method

```
#!/usr/local/bin/ruby  
# Example application to demonstrate some basic Ruby features  
# This code loads a given file into an associated application
```

```
class Launcher  
end  
launcher = Launcher.new
```

Adding behavior using the 'def' keyword followed by a method name then the argument list (if any)

Define method    method name    argument list

```
def initialize ( app_map )  
  @app_map = app_map  
end
```

## Ruby Class and Method

❖ A Ruby class  
`class Rectangle`  
`end`

To add `method` to class Rectangle

```
class Rectangle
  def area (hgt, width)
    return hgt*width
  end
end
```

Note: you don't really need the “(“ ”)” in Ruby  
it is purely for legibility purpose

**SHARE**  
Technology • Connections • Results

## Instance Variables

- ❖ Your initialize method takes one argument → `app_map`
- ❖ The “`app_map`” argument gets assigned to the variable `@app_map`
- ❖ The `@` symbol indicates that the variable is an instance variable
- ❖ You create this instance variable when you create your object, and it will be available to any other methods you add to your code

## Ruby Code Structure

```
def sayGoodnight(name)
  result = "Goodnight, " + name
  return result
end
```

```
# Time for bed...
puts sayGoodnight("John-Boy")
puts sayGoodnight("Mary-Ellen")
```

Goodnight, John-Boy  
Goodnight, Mary-Ellen

*\*The following lines are all equivalent\**

```
puts sayGoodnight "John-Boy"
puts sayGoodnight ("John-Boy")
puts (sayGoodnight ("John-Boy"))
```

# Sample Code (class and method) in Ruby

```
class AddressBook
  # Fundamental methods: initialize, add, remove
  def initialize
    @persons = []
  end
  def add(person)
    @persons += [person]
    @persons = @persons.sort{|a,b| by_name(a,b)}
  end
  ...

  private # Start private methods

  # Sorting function.
  def by_name(a,b)
    if a.first_name == b.first_name
      a.last_name <=> b.last_name
    else
      a.first_name <=> b.first_name
    end
  end
end
```

# Ruby Reuse with "require"

## ❖ Code reuse with "require"

```
require "addressbook"  
# Sandy Smith  
addr = Address.new  
addr.street = "324 Campus Dr."  
addr.city   = "College Park"  
addr.state  = "MD"  
addr.zip    = "23659"  
  
puts addr
```

Run the program, and you should get:

```
$ ruby prog.rb  
  
324 Campus Dr.  
College Park  
MD, 23659  
$
```

## Unique Feature Samples

### ❖ About ActiveRecord

- You don't have to write SQL
  - RoR knows how to build the SQL join for you
- Its about database.yml file
  - Supported by DB2 and other databases

### ❖ Use of Ajax Cart

- Ajax without using JavaScript
- You can click on the "Add to Cart" button and automatically update the cart on the page
  - Ruby and the built-in APIs
- Unlike JavaScript with XmlHttpRequest and then retrieve the XML response, followed by updating the pate
